

BEYOND THE EXPECTED.

Ex2900 / Ex3200 EXCLUSIVE FEATURES

Wet Disc Brakes

Provide positive stopping power and ensure longer brake life.

Optional Rear Remotes

Increases attachment capability in commercial and agricultural use.

Foldable ROPS

Allows for easier storage in low height entrances and the ability to get under obstacles.

Tight Turning Radius (8.2')

A 61" wheelbase allows this tractor to easily maneuver around tight areas.

Fully Hydraulic Power Steering

Delivers power from the hydraulic valve body to the front steering link through hydraulic lines. Makes for less steering wheel kickback in rough terrain, with or without loader, for easier, safer operation.

It also lowers the cost for owners throughout the life of the tractor by having less moving parts. Also, there is no steering shaft assembly or hydrostatic gearbox.

Dual Hydro Control Pedals

The dual pedals create greater operator comfort when changing direction. They are positioned in a more natural layout than a rocker pedal to lower operator fatigue.

Flip-Up PTO Shield

The PTO guard flips up to quickly and easily hook or unhook attachments.

Dual Gear-Driven Hydraulic Pumps w/Open Center

Two gear-driven hydraulic pumps with open center are driven off the engine, which delivers smoother and more consistent power. This results in greater usable hydraulic power by allowing the operator to operate the power steering simultaneously with front loader or any hydraulically powered attachment.

Powerful & Clean-Burning 28.7 or 32 HP* Diesel Engine

The highly efficient design of the direct injection diesel engine produces a powerful 23.4 and 25.5 HP* at the PTO. It also has a higher torque reserve than competitive indirect injection diesel engines to give the operator more power to tackle any job. The robust design of the power plant also reduces vibration and noise for improved operator comfort. Operator presence control (OPC) and key-stop round out this powerful package.

3-Range HST

Allows for greater power transfer and control throughout the infinite ground speed settings. Couple that with the direct-injection power plant to allow for higher operational ranges, thus reducing drive system temperatures for higher productivity and lower cost for owners throughout the life of the tractor's drive system.

Positive Position 3-Point Control

Provides greater control of rear and mid-mount attachments by allowing the operator to set attachments precisely where they need to be.

Selectable Control Valve

Located next to the operator's seat to reduce fatigue in the neck, shoulders and elbows for increased productivity when operating the loader. Includes lockout feature for added safety. Standard on Ex2900/3200 tractors.
